

This figure (See both pictures) shows a genomic region with open chromatin, gene expression, and chromatin interactions. The blue ATAC peaks indicate accessible DNA that may act as regulatory elements. The red RNA peaks show that the gene is being actively expressed. The purple Hi-C loops show interactions between different regions of the genome, suggesting that these open chromatin regions may help regulate gene expression. Overall, this shows how gene expression is influenced by both chromatin accessibility and 3D genome structure
